- #TROUBLESHOOTING
- 1 - PHONE NOT PLAYING THE VIDEO
    - swipe up on the app so that onscreen buttons appear
    - press the central button
    - press 'close all apps'
    - press the 'difficult to work with' app on the home screen
    - press the dolls head image to reboot video (wait a few seconds for it to s
  - ALTERNATIVE
    - hold phone power button and tap Power Off when prompted
    - after shutdown hold phone button to power on again
    - the app will automatically reboot after 60 seconds
  - 2 - PHONE NOT PLAYING THE CAMERA FEED / THE CAMERA FEED IS BLACK
    - Check the cameras power is on
    - connect a laptop to the wifi network and test opening the stream in VLC wi
    - it should play the feed for you (if it doesnt contact me)
    - Then repeat the instructions for issue 1 to reboot the app
    - if issue persists turn off the phone and all power supplies, wait 10 secon
    - morning
    - if issue still persists check phone wifi issue 3
  - 3 - PHONE NOT CONNECTED TO WIFI
    - Check the router is powered on
    - Check the wifi network name 'difficult\_to\_work\_with' appears on a second d
    - Open the phone settings app
    - Tap on the first item Wifi Connections
    - Check the wifi network appears and select it
    - Then follow issue 1 for closing all apps and rebooting the video
  - 4 - INTERCOM NOT PLAYING SOUND OR NOT TRIGGERING VIDEO FEED ON PHONE & MONIT
    - Power off the intercom at the switch
    - wait 10 seconds and power on again
    - wait 30 seconds by the intercom and you should hear a lock test and a soun
    - Once the intercom is rebooted the phone will also need to reconnect - foll
    - restart app.
    - test everything is in sync by pressing the button
  - 5 - INTERCOM IS PLAYING SOUNDS, BUT NOT TRIGGERING PHONE
    - Either the intercom is disconnected from the wifi, the phone is disconnect
    - of sync.
    - check that the intercom is connected on the wifi (I use the app Fing and c
    - device called intercom.local)
    - go through issue 3
    - if still out of sync power cycle the whole exhibition off and on again to
    - off, phone socket off, phone off, intercom socket on, phone socket on, phone
  - 6 - INTERCOM NOT UNLOCKING THE DOOR
    - Check power supplies to both the pi and the lock
    - check that the intercom is connected on the wifi (I use the app Fing and c
    - device called intercom.local)
    - if the intercom is connected to the wifi but not unlocking the door then i
    - having enough power so try leave it for a while to cool or replace the power
    - if the pi has power but is not listed on the wifi then something is wrong
    - remove the cover from the intercom and see if any lights are lit on the pi
    - likely is the power supply is loose, or faulty like we had before.
    - if the pi still doesnt boot with a new power supply then contact me
  - 7 -ISSUES PERSIST OR NOT LISTED

# V&A South Kensington ribbon.Py: fate spinning, curve fitting

A collaboration between performance and predictive algorithms

Special event

Friday, 24 September 2021 at V&A South Kensington

V&A South Kensington Past event

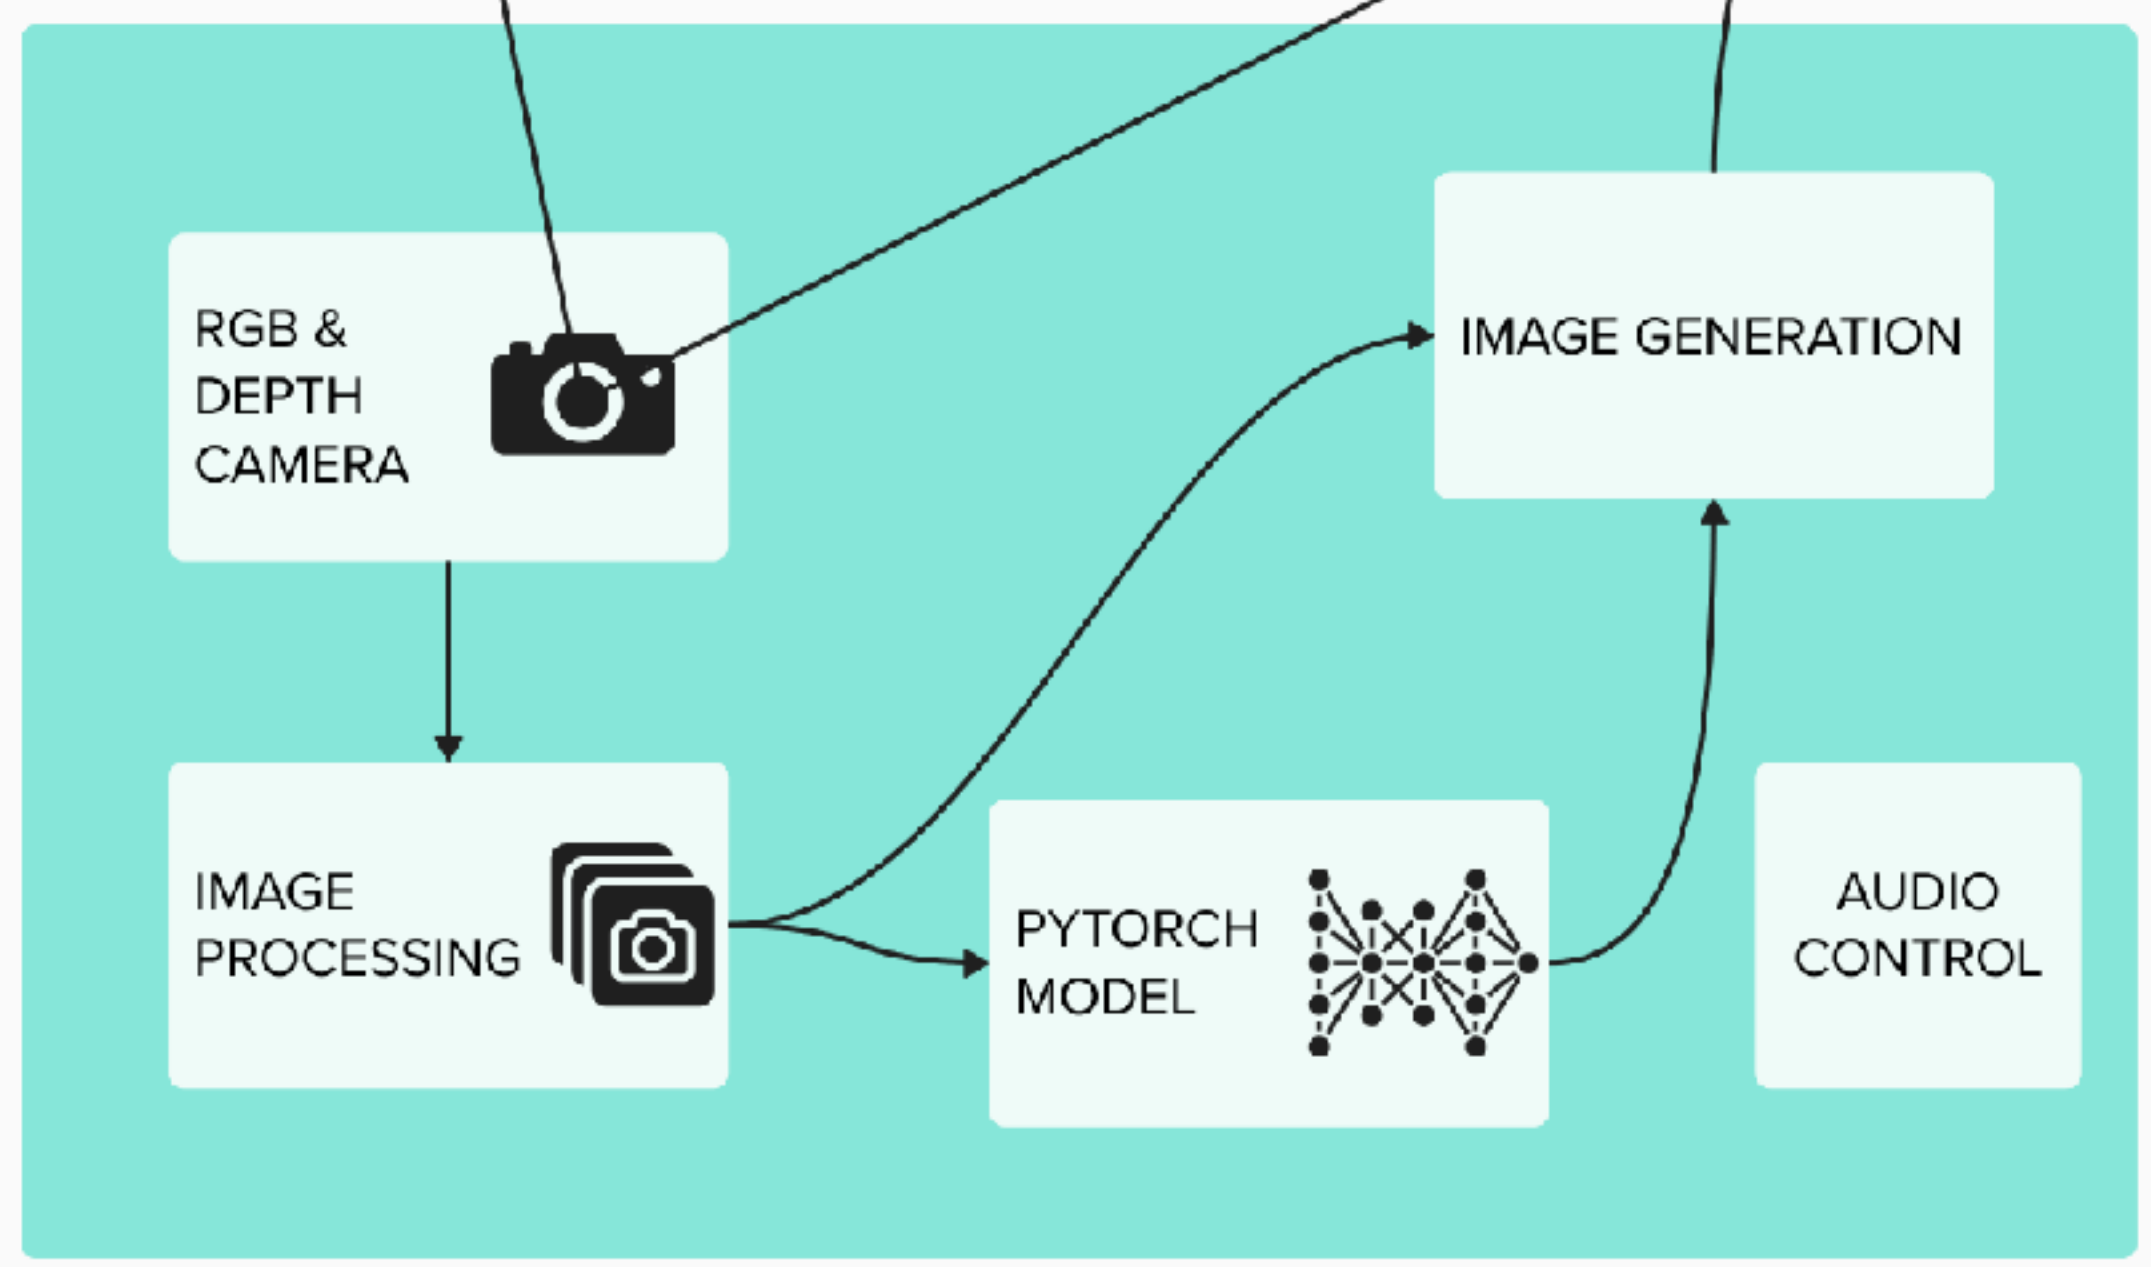

Learn more about the predictive algorithms used to project climate change through this intriguing performance by artist/design duo Legrand Jäger (Guillemette Legrand and Eva Jäger). Using machine vision software developed with Isaac Clarke, the performance analyses and diagrams the curves produced by rhythmic gymnast, Mimi-Isabella Cesar, and her ribbon. Music developed with Tommie Introna. Note: Performances will run on the hour, every hour, between 13.00 and 17.00 and during the Friday Late.

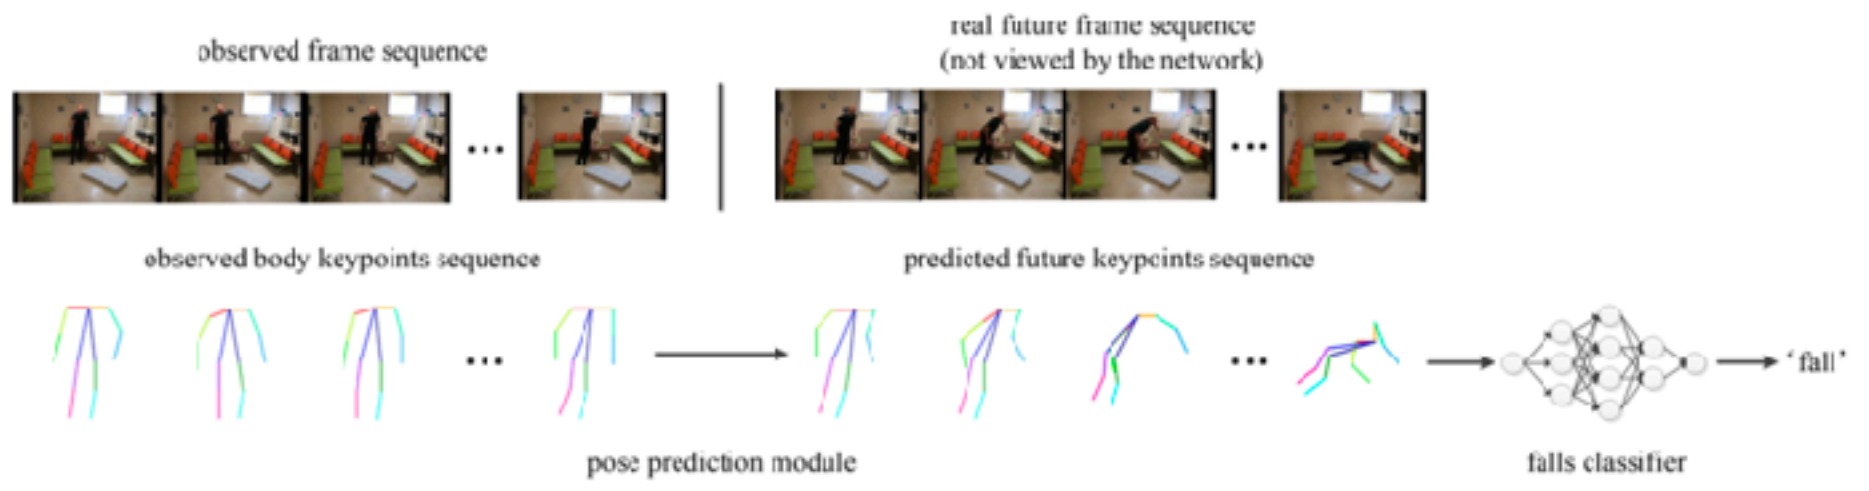

Figure 2. The major work flow of our model. A sequence of observed frames is input to the network. Then the human body keypoints are extracted from each frame to form a keypoints sequence, which is used to predict future keypoints sequence by the pose prediction module. At last, the predicted body pose is passed into a falls classifier to judge whether the person will fall down in the future.

### 3. Methodology

#### 3.1. Overview of the Proposed Model

The problem to be solved in this paper is formulated as follow: Given  $t_{obs}$  observed frames ( $f_1, f_2, \dots, f_{t_{obs}}$ ), we try to predict whether the human(s) in the video will fall down in next  $t_{pred}$  frames (i.e., from  $f_{t_{obs}+1}$  to  $f_{t_{obs}+t_{pred}}$ ).

The skeleton framework of our model is presented in Fig. 2. The input is a sequence of observed frames. We first adopted OpenPose [4] to extract keypoints coordinates of human(s) from each of detected persons using algorithm, to cluster same person in different person was corresponding  $K_{obs}^i = (k_1^i, k_2^i, \dots, k_{t_{obs}}^i)$  coordinates of the  $i$ -th

Based on the observed relative position between keypoints, a keypoints vectorization from coordinate representation of the  $i$ -th person was. Then, the pose prediction architecture [30] was used to predict  $t_{pred}$  frames. Consider shorter consecutive keypoints shorten the lengths of bodies. Moreover, shorter sequence pose problem caused by

After that,  $k_{t_{obs}+t_{pred}}^i$   $i$ -th person at frame  $f_t$  classification. The fall network and was trained in which each frame was. Combining the pose prediction model was capable

#### 3.2. Keypoints Vectorization

The keypoints coordinates extracted by OpenPose [4] cannot reflect the correlation between different keypoints, and suffered from the effects of body skeleton's absolute position and scale. With the motivation that the same pose should be represented by the same keypoints vector, we exploited the following keypoints vectorization method.

As we know, the 18 keypoints of MS COCO [19] are nose, neck, left and right shoulders, elbows, wrists, hips, knees, ankles, eyes and ears. Since we focused on the body

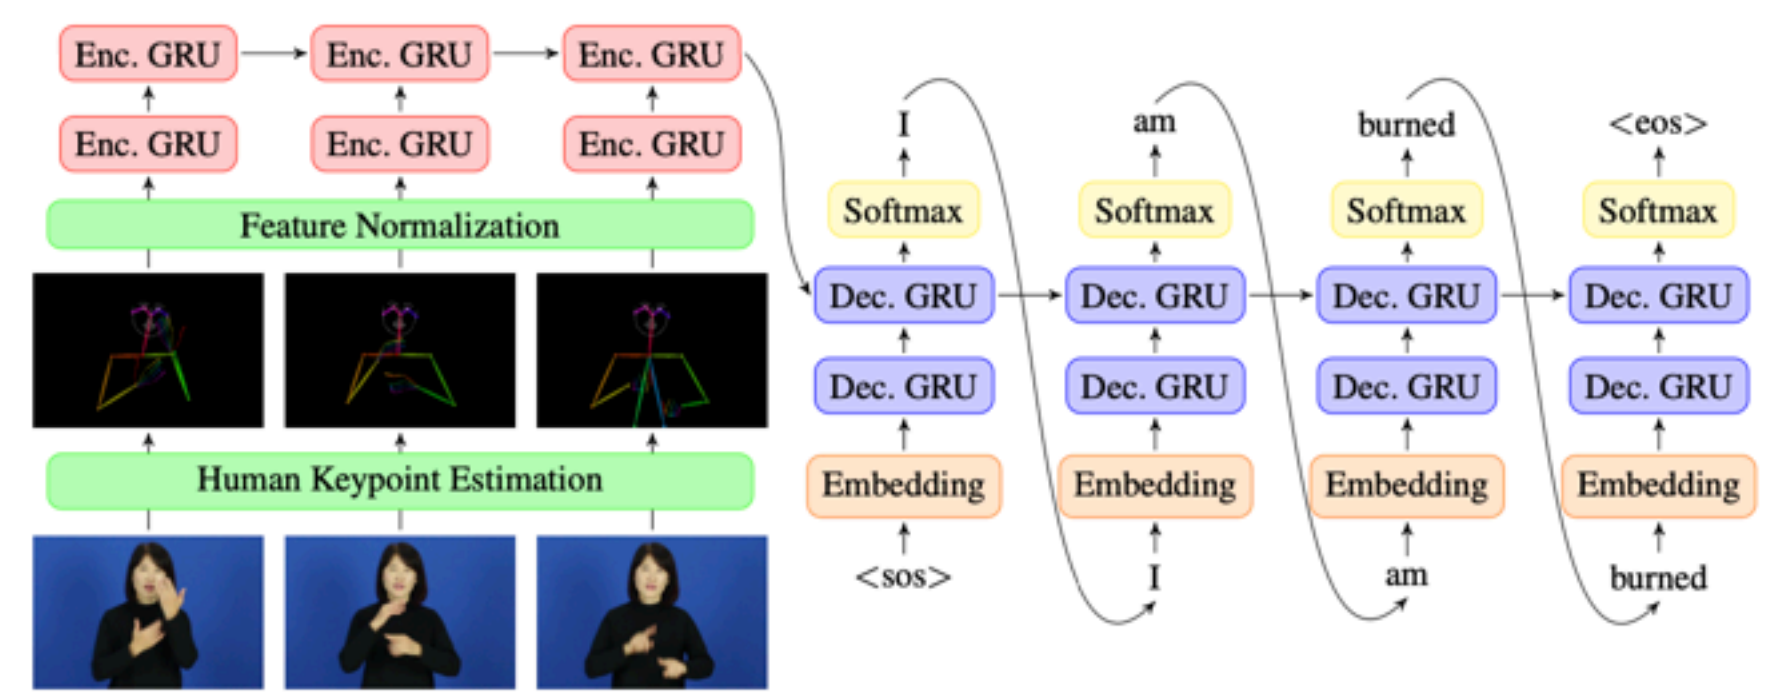

Figure 4. An overall architecture of our approach that translates a sign language video into a natural language sentence using sequence to sequence model based on GRU cells.

#### 4.1. Human Keypoint Detection by OpenPose

First, our recognition system is expected to be robust in different cluttered backgrounds as it only detects the human body. Second, the system based on the human keypoint detection works well regardless of signer since the variance of extracted keypoints are negligible. Moreover, we apply the feature normalization technique to further reduce the variance which is

## Random Temporal Skipping for Multirate Video Analysis

Yi Zhu<sup>1</sup> and Shawn Newsam<sup>1</sup>

University of California at Merced, Merced CA 95343, USA  
 {yzhu25, snewsam}@ucmerced.edu

**Abstract.** Current state-of-the-art approaches to video understanding adopt temporal jittering to simulate analyzing the video at varying frame rates. However, this does not work well for multirate videos, in which actions or subactions occur at different speeds. The frame sampling rate should vary in accordance with the different motion speeds. In this work, we propose a simple yet effective strategy, termed random temporal skipping to address this situation. This strategy effectively handles multi-rate outputs are applied to a robot platform, NAO, for demonstration for social interactions. The proposed system can run in real-time with NVidia RTX 2080 Ti graphics card.

## SPECTRAL PLAIN

---

Spectral Plain is a multiplayer game-environment powered by sensing (cosmic radiation sensor) and AI technology (GPT-3), where players collectively engage in the making of cosmological imaginations by navigating through the ecologies of spectral energies.

---

Following a geomagnetic event, energies have become unchanneled, and an opportunity for a new network of connections has emerged. To build this network cosmology, three players enter a 'cosmic stack'; a world composed of celestial, terranean, and infracosmic realms, where they interact with an ecology of energised entities that seek to find their place on an alternative spectrum of electromagnetic frequencies. The player's must find their way to Spectral Plain, and meet at the flames of a campfire, where their journeys converge to form a stereoscopic cosmogram.

As the players navigate the game environment, information about their encounters with cosmological signs ('triangle', 'circle', 'cross', 'square') are recorded, and is combined with data produced by a cosmic radiation sensor that senses the player's presence in the physical space. This dataset is then processed by a language prediction model (GPT-3) that has been optimised using technical and mythological understandings of electromagnetic energy, resulting in the unique cosmogram and an accompanying reading.

The research is contextualised in the deployment of the 5G network; a planetary-scale infrastructure that is narrativised as a global, hyper-efficient mesh of connecting nodes. More than mere representation, this combination of hard and software shapes our cosmological belief systems, creating a specific imagination of the planetary. We see our current ecology crises are cosmological in essence, requiring us to conjure new spaces where we can re-engage in the collective making of planetary imaginations.

I believe in unicorns because, as humans, they have always liked birds." -- Robert Spencer, Christian Science Monitor

"Wacky Planet." (2012). Fox News interview with Kevin Drum (2 mins, 25 seconds; 1 minute 49 seconds on video). (8 minutes long) Link: <http://www.foxnews.com/id/18651052> Source: <http://www.fox.com/news/2015-09-16/science-science-can-be>

I believe in unicorns because unicorns were raised against kings and queens. I believe in angels because angels are like angels raised from Hell.

People have an uncanny aversion toward things outside of their personal experience: their emotions. If the opposite doesn't happen, that doesn't bother you. However in some cases, you can have a feeling of loneliness with the intention of coming into contact with a phantom.

There's no evidence that your belief will allow you to understand and control this or

I believe in unicorns because it's like God told these children I was going to throw out the house." In any case, though—that is when the two became good friends, on the verge of making his real name—the young man recalls getting together with a co-worker for the evening at the Groom's Deli, where "you would come over for drinks with Groom but wouldn't know whether to say hello, or if you would speak with Groom." As Groom

I believe in unicorns because unicorns are really, really wonderful, and when I hear myself speak like they are that's where my belief is I do hope my kids can grow up to take root my belief of unicorns in the best way I know how but I just need time to realize to keep it from going out the way I want them."

Walking back to his seat of old, Harry walked out of the bedroom, quickly coming back out the door, wearing a red cloak

I believe in unicorns because unicorns will only help when you have to use you money or when you can sell your ass off to do your little own thing or when you can get rich doing your own thing.

"You are an awesome human because you were able to survive and prosper because you were with me and your father. Why you are different from me?"

When I am with a girl, I am only happy if you live together and together you do something fun for each

I believe in unicorns because for myself and the entire galaxy, unicorns make sense. In most respects, unicorns should really not exist at all for the vast majority of peoples worldwide.

However, I've found that it is hard to write as a conservative-leaning social justice warrior since my views differ somewhat from those articulated in this site's recent comments thread. This is a real challenge and because "conservative" has become one of the most popular online subcultures in existence - you can

I believe in unicorns because I really do like unicorns so I think it is fitting that I would join my other half. There can be some magic in living with your unicorns and as they grow (i.e. a bit younger with each passing year), my wish would be to have fun with them while growing and sharing my experience with them. There may come a day I want to do something crazy that people think will make me better and they are waiting. But after that day comes

I believe in unicorns because no matter what I do or say, they're going to become their own creature (that is, you've done nothing wrong)." To be fair, the reason certain people like to worship unicorns is because they take an interest in them. "Well let a unicorn do the things they'd do in any other circumstance and they'll do it to your face to please themselves while watching," the god of life wrote on his personal blog, Goonies. It was the creator

I believe in unicorns because both of us believe like God that we are born of something divine."

In a March 2014 speech to the London School of Economics, Cruz called for tax increases on capital gains - and added, "And for my part, this must also be a very clear signal when you see that a few hundred billion Americans have already cut taxes for the top quintile (for the 1%, for example). There are billions on those very large taxes every year." The following morning

I believe in unicorns because of this book of mine, and I read this once or twice every week. The first part is, The First Tree, because, well, you don't believe in unicorns!

## [ISEA2023] Artist Talk: Vincent Thornhill, Guillemette Legrand & Isaac Clarke — Spectral Plain: a case study for exploring the world-building potential of co-creative systems that combine text generation models with game mechanics

### Artist Statement

Theme *Immersion(s)* Subtheme *Symbiotic Imaginaries*

A presentation of the game installation Spectral Plain; an interactive artwork that intersects algorithmic, sensing, and gaming technologies to explore new forms of generative and co-creative world-building processes that seek to simulate multiscalar and pluralistic imaginations of the planet.

- **Vincent Thornhill** is a designer; artistic researcher at KU Leuven / LUCA School of Arts, Belgium; and educator at the Design Academy Eindhoven, NL. Their practice questions humanistic readings of digital image infrastructure, with a focus on image processing algorithms.
- **Guillemette Legrand** is an artist and designer affiliated with the research group Reflective Interaction of the EnsadLab (École des Arts Décoratifs, Paris, France). Their practice engages with machine-fictioning and worlding techniques to simulate other possible imaginations of computational logic and the visual culture that emerge from it.
- *Isaac Clarke* is a fictional character in the survival horror media franchise Dead Space, owned and published by Electronic Arts [https://en.wikipedia.org/wiki/Isaac\\_Clarke](https://en.wikipedia.org/wiki/Isaac_Clarke)
